

TEST REPORT

ACCORDING TO: FCC CFR 47 PART 15 Subpart C, §15.247 and
RSS-210, Issue 7, Annex 8

FOR:

**Bioness Neuromodulation Ltd. -
A Bioness Inc Company**

Trade mark: NESS L300 Plus

Model: Thigh RF Stimulation Unit

This report is in conformity with ISO/ IEC 17025. The "A2LA Accredited" symbol endorsement applies only to the tests and calibrations that are listed in the scope of Hermon Laboratories accreditation. The test results relate only to the items tested. This test report shall not be reproduced in any form except in full with the written approval of Hermon Laboratories Ltd.

Client name: Bioness Neuromodulation Ltd. - A Bioness Inc Company
Address: P.O.Box 2500, 19 Ha'haroshet street, Ra'anana 43654, Israel
Telephone: +972 9790 7100
Fax: +972 9748 5740
E-mail: eyal.lasko@bioness.co.il
Contact name: Mr. Eyal Lasko

2 Equipment under test attributes

Product: RF Stimulation Unit
Trade mark: NESS L300 Plus
Model(s): Thigh RF Stimulation Unit
Part number: 502-00034-01
Serial number: 00038
Hardware version: 2.0 (120 mA/180 V)
Receipt date 10/18/2010

3 Manufacturer information

Manufacturer name: Bioness Neuromodulation Ltd. - A Bioness Inc Company
Address: P.O.Box 2500, 19 Ha'haroshet street, Ra'anana 43654, Israel
Telephone: +972 9790 7100
Fax: +972 9748 5740
E-Mail: eyal.lasko@bioness.co.il
Contact name: Mr. Eyal Lasko

4 Test details

Project ID: 21179
Location: Hermon Laboratories Ltd. Harakevet Industrial Zone, Binyamina 30500, Israel
Test started: 10/18/2010
Test completed: 12/02/2010
Test specification(s): FCC 47CFR Part 15, subpart C, §15.247;
RSS-210 Issue 7:2007, Annex 8; RSS-Gen Issue 2:2007

5 Tests summary

| Test | Status |
|--|---|
| Transmitter characteristics | |
| FCC section 15.247(a)(2), RSS-210 section A8.2(a), 6 dB bandwidth | Pass |
| FCC section 15.247(b)(3), RSS-210 section A8.4(4), Peak output power | Pass |
| FCC section 15.247(d), RSS-210 section A8.5, Radiated spurious emissions | Pass |
| FCC section 15.247(e), RSS-210 A8.2(b), Peak power density | Pass |
| FCC section 15.247(i)/ RSS-Gen, section 5.5, RF exposure | Pass, Exhibit provided in documentation for Application |
| FCC section 15.207(a), RSS-Gen section 7.2.2, Conducted emission | Pass |
| Unintentional emissions | |
| RSS-Gen section 7.2.3.2, Radiated emission | Pass |

Testing was completed against all relevant requirements of the test standard. The results obtained indicate that the product under test complies in full with the requirements tested.
The test results relate only to the items tested. Pass/ fail decision was based on nominal values.

6 EUT description

6.1 General information

The EUT, "Thigh RF Stimulation Unit", is a transceiver, part of the Functional Electrical Stimulation system that is used to correct foot drop and/or knee weakness syndromes.

The EUT function is to generate electrical stimulation pulses. The "Thigh RFS" is a device comprised of custom designed electrical circuit and embedded SW. It utilizes an RF link to communicate with "L300 Plus Control Unit" and GS (Gait Sensor). The "Thigh RFS" consists of small PCB with an integrated RF transceiver, inside a plastic enclosure and is powered by rechargeable 3.7V Lilon battery. It is considered as internally powered unit (connected to AC/DC adaptor only in charging mode).

6.2 Ports and lines

| Port type | Port description | Conn. from | Conn. to | Qty. | Cable type | Cable length |
|-----------------|--------------------|----------------|------------|------|------------|--------------|
| Power | DC power | AC/DC adaptor* | EUT | 1 | Unshielded | 2.2 m |
| Patient-coupled | Stimulation signal | EUT | Electrodes | 2 | Unshielded | 0.20 m |

* -for charging only

6.3 Support and test equipment

| Description | Manufacturer | Model number | Serial number |
|-------------------------|--------------|--------------|---------------|
| AC/DC adaptor (charger) | Friwo | FW7555M/05 | 809T |

6.4 Changes made in the EUT

No changes were implemented.

7 Transmitter tests according to 47CFR part 15 subpart C and RSS-210 requirements

7.1 Minimum 6 dB bandwidth

7.1.1 General

This test was performed to measure 6 dB bandwidth of the EUT carrier frequency. Specification test limits according to FCC part 15 section 15.247(a)(2) and RSS-210 section A8.2(a) are given in Table 7.1.1.

Table 7.1.1 The 6 dB bandwidth limits

| Assigned frequency, MHz | Modulation envelope reference points*, dBc | Minimum bandwidth, kHz |
|-------------------------|--|------------------------|
| 902.0 – 928.0 | 6.0 | 500.0 |
| 2400.0 – 2483.5 | | |
| 5725.0 – 5850.0 | | |

* - Modulation envelope reference points provided in terms of attenuation below the peak of modulated carrier.

7.1.2 Test procedure

7.1.2.1 The EUT was set up as shown in Figure 7.1.1, energized and its proper operation was checked.

7.1.2.2 The EUT was set to transmit modulated carrier.

7.1.2.3 The transmitter minimum 6 dB bandwidth was measured with spectrum analyzer as frequency delta between reference points on modulation envelope and provided in Table 7.1.2 and the associated plots.

7.2 Peak output power

7.2.1 General

This test was performed to measure the maximum peak output power radiated by transmitter. Specification test limits according to FCC part 15 section 15.247(b)(3) and RSS-210 section A8.4(4) are given in Table 7.2.1.

Table 7.2.1 Peak output power limits

| Assigned frequency range, MHz | Maximum antenna gain, dBi | Peak output power* | | Equivalent field strength limit @ 3m, dB(μV/m)** |
|-------------------------------|---------------------------|--------------------|------|--|
| | | W | dBm | |
| 2400.0 – 2483.5 | 6.0 | 1.0 | 30.0 | 131.2 |

*- The limit is provided in terms of conducted RF power at the antenna connector. If transmitting antennas of directional gain greater than 6 dBi are used, the peak output power limit shall be reduced below the stated value as follows:

by 1 dB for every 3 dB that the directional gain of antenna exceeds 6 dBi for fixed point-to-point transmitters operate in 2400-2483.5 MHz band;
without any corresponding reduction for fixed point-to-point transmitters operate in 5725-5850 MHz band;
by the amount in dB that the directional gain of antenna exceeds 6 dBi for the rest of transmitters.

** - Equivalent field strength limit was calculated from the peak output power as follows: $E = \sqrt{30 \times P \times G} / r$, where P is peak output power in Watts, r is antenna to EUT distance in meters and G is transmitter antenna gain in dBi.

7.2.2 Test procedure

7.2.2.1 The EUT was set up as shown in Figure 7.2.1, energized and its proper operation was checked.

7.2.2.2 The EUT was adjusted to produce maximum available to end user RF output power.

7.2.2.3 The field strength of the EUT fundamental emission was measured in 3 orthogonal positions of the device.

7.2.2.4 The resolution bandwidth of spectrum analyzer was set wider than 6 dB bandwidth of the EUT and the field strength of the EUT carrier frequency was measured with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360° and the measuring antenna height was swept in both vertical and horizontal polarizations.

7.2.2.5 The maximum field strength of the EUT carrier frequency was measured as provided in Table 7.2.2 and associated plots.

7.2.2.6 The maximum peak output power was calculated from the field strength of carrier as follows:

$$P = (E \times d)^2 / (30 \times G),$$

where P is the peak output power in W, E is the field strength in V/m, d is the test distance and G is the transmitter numeric antenna gain over an isotropic radiator.

The above equation was converted in logarithmic units for 3 m test distance:

$$\text{Peak output power in dBm} = \text{Field strength in dB}(\mu\text{V/m}) - \text{Transmitter antenna gain in dBi} - 95.2 \text{ dB}$$

7.2.2.7 The worst test results (the lowest margins) were recorded in Table 7.2.2.

7.3 Field strength of spurious emissions

7.3.1 General

This test was performed to measure field strength of spurious emissions from the EUT. Specification test limits according to FCC part 15 section 15.247(c) and RSS-210 section 6.2.2(o)(e1) are given in Table 7.3.1.

Table 7.3.1 Radiated spurious emissions limits

| 1000 – 10 th harmonic | 74.0 | NA | 54.0 | |

*- The limit for 3 m test distance was calculated using the inverse square distance extrapolation factor as follows:

$$\text{Lim}_{S_2} = \text{Lim}_{S_1} + 40 \log(S_1/S_2),$$

where S_1 and S_2 – standard defined and test distance respectively in meters.

** - The limit decreases linearly with the logarithm of frequency.

*** - The field strength limits applied from the lowest radio frequency generated in the device, without going below 9 kHz up to the tenth harmonic of the highest fundamental frequency.

7.3.2 Test procedure for spurious emission field strength measurements in 9 kHz to 30 MHz band

7.3.2.1 The EUT was set up as shown in Figure 7.3.1, energized and the performance check was conducted.

7.3.2.2 The specified frequency range was investigated with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated around its vertical axis.

7.3.2.3 The worst test results (the lowest margins) were recorded and shown in the associated plots.

7.3.3 Test procedure for spurious emission field strength measurements above 30 MHz

7.3.3.1 The EUT was set up as shown in Figure 7.3.2, energized and the performance check was conducted.

7.3.3.2 The specified frequency range was investigated with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360°, the measuring antenna height was changed from 1 to 4 m, its polarization was switched from vertical to horizontal.

7.3.3.3 The worst test results (the lowest margins) were recorded and shown in the associated plots.

*- EUT front panel refers to 0 degrees position of turntable.

**- Margin = Measured field strength - specification limit.

***- Margin = Calculated field strength - specification limit,

where Calculated field strength = Measured field strength + average factor.

Table 7.3.4 Average factor calculation

| Transmission pulse | | Transmission burst | | Transmission train duration, ms | Average factor, dB |
|-----------------------------------|------------|--------------------|------------|---------------------------------|--------------------|
| Duration, ms | Period, ms | Duration, ms | Period, ms | | |
| Refer to manufacturer declaration | | | | | -18.41 dB |

*- Average factor was calculated as follows

for pulse train shorter than 100 ms:

$$\text{Average factor} = 20 \times \log_{10} \left(\frac{\text{Pulse duration}}{\text{Pulse period}} \times \frac{\text{Burst duration}}{\text{Train duration}} \times \text{Number of bursts within pulse train} \right)$$

for pulse train longer than 100 ms:

$$\text{Average factor} = 20 \times \log_{10} \left(\frac{\text{Pulse duration}}{\text{Pulse period}} \times \frac{\text{Burst duration}}{100\text{ms}} \times \text{Number of bursts within 100ms} \right)$$

7.4 Peak spectral power density

7.4.1 General

This test was performed to measure the peak spectral power density radiated by the transmitter RF antenna. Specification test limits according to FCC part 15 section 15.247(d) and RSS-210 section A8.2(b) are given in Table 7.4.1.

Table 7.4.1 Peak spectral power density limits

| Assigned frequency range, MHz | Measurement bandwidth, kHz | Peak spectral power density, dBm | Equivalent field strength limit @ 3m, dB(μV/m)* |
|-------------------------------|----------------------------|----------------------------------|---|
| 2400.0 – 2483.5 | 3.0 | 8.0 | 103.2 |

* - Equivalent field strength limit was calculated from the peak spectral power density as follows: $E = \sqrt{30 \times P} / r$, where P is peak spectral power density and r is antenna to EUT distance in meters.

7.4.2 Test procedure for field strength measurements

- 7.4.2.1 The EUT was set up as shown in Figure 7.4.1, energized and its proper operation was checked.
- 7.4.2.2 The EUT was adjusted to produce maximum available to end user RF output power.
- 7.4.2.3 The field strength of the EUT carrier frequency was measured with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360° and the measuring antenna height was swept in both vertical and horizontal polarizations.
- 7.4.2.4 The frequency span of spectrum analyzer was set to capture the entire 6 dB band of the transmitter, in peak hold mode with resolution bandwidth set to 3.0 kHz, video bandwidth wider than resolution bandwidth, auto sweep time and sufficient number of sweeps was allowed for trace stabilization. The spectrum lines spacing was verified to be wider than 3 kHz. Otherwise the resolution bandwidth was reduced until individual spectrum lines were resolved and the power of individual spectrum lines was integrated over 3 kHz band.
- 7.4.2.5 The peak of emission was zoomed with span set just wide enough to capture the emission peak area and sweep time was set equal to span width divided by resolution bandwidth. Spectrum analyzer was set in peak hold mode, sufficient number of sweeps was allowed for trace stabilization and peak spectral power density was measured as provided in Table 7.4.2, Table 7.4.3 and the associated plots.

Table 7.4.2 Field strength measurement of peak spectral power density

ASSIGNED FREQUENCY RANGE: 2400.0 – 2483.5 MHz
 TEST DISTANCE: 3 m
 TEST SITE: OATS
 EUT HEIGHT: 0.8 m
 DETECTOR USED: Peak
 RESOLUTION BANDWIDTH: 3 kHz
 VIDEO BANDWIDTH: 10 kHz
 TEST ANTENNA TYPE: Double ridged guide (above 1000 MHz)
 MODULATION: FSK
 MODULATING SIGNAL: Binary data message
 BIT RATE: 250 kbps
 TRANSMITTER OUTPUT POWER SETTINGS: Maximum
 TRANSMITTER OUTPUT POWER: 0.93 dBm at low carrier frequency
 1.25 dBm at mid carrier frequency
 0.37 dBm at high carrier frequency

| Frequency, MHz | Field strength, dB(μV/m) | EUT antenna gain, dBi | Limit, dB(μV/m) | Margin, dB* | Antenna polarization | Antenna height, m | Turn-table position**, degrees |
|----------------|--------------------------|-----------------------|-----------------|-------------|----------------------|-------------------|--------------------------------|
| 2400.833 | 89.21 | 1.5 | 103.23 | -15.52 | Hor | 1.2 | 340 |
| 2440.826 | 88.69 | 1.5 | 103.23 | -16.04 | Hor | 1.2 | 340 |
| 2482.076 | 88.65 | 1.5 | 103.23 | -16.08 | Hor | 1.2 | 340 |

*- Margin = Field strength - EUT antenna gain - calculated field strength limit.

**-. EUT front panel refer to 0 degrees position of turntable.

Table 7.4.3 Substitution measurement of peak spectral power density

ASSIGNED FREQUENCY RANGE: 2400 – 2483.5 MHz
 TEST DISTANCE: 3 m
 SUBSTITUTION ANTENNA HEIGHT: 0.8 m
 DETECTOR USED: Peak
 RESOLUTION BANDWIDTH: 3 kHz
 VIDEO BANDWIDTH: 10 kHz
 SUBSTITUTION ANTENNA TYPE: Double ridged guide (above 1000 MHz)

| Frequency, MHz | Field strength, dB(μV/m) | Antenna polarization | RF generator output, dBm | Antenna gain, dBi | Cable loss, dB | EUT ant. gain, dBi | Peak power density*, dB(mW/3 kHz) | Limit, dBm | Margin, dB** | Verdict |
|----------------|--------------------------|----------------------|--------------------------|-------------------|----------------|--------------------|-----------------------------------|------------|--------------|---------|
| 2400.833 | 89.21 | Hor | -15.63 | 9.17 | 1.46 | 1.5 | -7.92 | 8.00 | -15.92 | Pass |
| 2440.826 | 88.69 | Hor | -16.06 | 9.21 | 1.47 | 1.5 | -8.32 | 8.00 | -16.32 | Pass |

7.5 Conducted emissions

7.5.1 General

This test was performed to measure common mode conducted emissions at the power port. Specification test limits are given in Table 7.5.1.

Table 7.5.1 Limits for conducted emissions

| Frequency, MHz | Class B limit, dB(μV) | |
|----------------|-----------------------|----------|
| | QP | AVRG |
| 0.15 - 0.5 | 66 - 56* | 56 - 46* |
| 0.5 - 5.0 | 56 | 46 |
| 5.0 - 30 | 60 | 50 |

* - The limit decreases linearly with the logarithm of frequency.

7.5.2 Test procedure

7.5.2.1 The EUT was set up as shown in Figure 7.5.1, energized and the performance check was conducted.

7.5.2.2 The measurements were performed at power terminals with the LISN, connected to a spectrum analyzer while unused coaxial connector of the LISN was terminated with 50 Ohm.

7.5.2.3 The position of the device cables was varied to determine maximum emission level.

7.5.2.4 The worst test results (the lowest margins) were recorded in Table 7.5.2 and shown in the associated plots.

7.6 Radiated emission measurements

7.6.1 General

This test was performed to measure radiated emissions from the EUT enclosure. Specification test limits according to RSS-Gen, Section 6 are given in Table 7.6.1.

Table 7.6.1 Radiated emission limits according to RSS-Gen, Section 6

| Frequency, MHz | Field strength limit at 3 m test distance, dB(μV/m) |
|----------------------------------|---|
| 30 - 88 | 40.0 |
| 88 - 216 | 43.5 |
| 216 - 960 | 46.0 |
| 960 - 3 rd harmonic** | 54.0 |

** - harmonic of the highest frequency the EUT generates, uses, operates or tunes to.

7.6.2 Test procedure for measurements in semi-anechoic chamber

7.6.2.1 The EUT was set up as shown in Figure 7.6.1, energized and the performance check was conducted.

7.6.2.2 The specified frequency range was investigated with biconilog antenna connected to EMI receiver. To find maximum radiation the turntable was rotated 360°, the measuring antenna height was changed from 1 to 4 m, its polarization was switched from vertical to horizontal and the EUT cables position was varied.

7.6.2.3 The worst test results (the lowest margins) were provided in the associated tables and plots.

Hermon Laboratories is accredited by A2LA for calibration according to present requirements of ISO/IEC 17025 and NCSL Z540-1. The accreditation is granted to perform calibration of parameters that are listed in the Scope of Hermon Laboratories Accreditation.

Hermon Laboratories calibrates its reference and transfer standards by calibration laboratories accredited to ISO/IEC 17025 by a mutually recognized Accreditation Body or by a recognized national metrology institute. All reference and transfer standards used in the calibration system are traceable to national or international standards.

In-house calibration of all test and measurement equipment is performed on a regular basis according to Hermon Laboratories calibration procedures, manufacturer calibration/verification procedures or procedures defined in the relevant standards. The Hermon Laboratories test and measurement equipment is calibrated within the tolerances specified by the manufacturers and/or by the relevant standards.

10 APPENDIX C Test laboratory description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private, EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01) and approved by Israel Ministry of environmental protection, radiation hazards department (Permit number 1158). The FCC Designation Number is US1003.
